The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?
Iapproache the challenge through understanding what I did in the skillbuilders.
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?
I found that trying to extract the last digit was pretty confusing, but I had recalled a previous python project where I used remainders and division to extract the last digit of a number.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?
I had broken the problem into extracting the number first and then formulating a sum.
How did you decide on the tools, data structures, or algorithms to use?
I knew I had to use a while loop because the user neeeded multiple attempts until the could guess the actual number.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?
I had written the code in small pieces, by first writing the code in order to extract the final digit and then make it formulate a sum.
How did you test your solution along the way to make sure it was working?
I would input number like "11111" which I already knew they would add up to 5, so I could figure out if the code executed properly

Overcoming Challenges

What part of the problem was the most difficult for you?
Removing the last digit of the number then adding it.
How did you handle moments when you felt stuck or unsure of what to do next?
I refered back to the textbook, and researched any parts which were not elaborated on.

Learning

Was there anything you learned that you think will help you with future challenges?
Having a program able to extract digits from a series of number inputted can aid in various programming application, instead of a user assigning a new value each time, they can enter in all there values at once.
