1. A loop structure's purpose is to repeatedly exececutre lines of code until the conditions that are listed are met. This aids in the reduction of code duplication and makes the appearance of the code much cleaner.
2. A while loop checks the condition prior to the beginning of the loop, so an error message would appear if the condition was false. However, a do while loop will always run atleast one time.
3. NumberSum Skillbuilder
4. a)The code will repeatedly loop because theu are no conditions specified for it to stop
   BWhether the conditions are not defined at all or simply not programmed accurately.
   c)If the loop is infinite, the computer wil store each loop in its memory, but this memory will eventually depletes. This leads to an immense overflow, then the computer will provide a message stating that "memory capacity has been exceeded

5. 60 times
6. Value which is less than 120
7. A counter is used to count how many times something has occurred. Conversely, an accumulator tracks a running of total values. A counter can limit and count how many loops occurred to prevent memory overflow, it can also track events in code. Accumaltots calculate totals and averages.
8. ```
   int sum = 0
   for (int i=3; i<=10;i++{
         sum +=i;
         }
   ```

9. YOut choices are decided by whether youunder the amount of iterations of the code or after, or after you run the program.

11
A)9
B) my
c) my string
d) my string
e)my string
   ```
