Include your IPO Chart with your code in Eclipse IDE: We will discuss and demonstrate this in the computer lab.

IPO CHART

Program name:	Energy application with $e=mc^2$	
INPUT	PROCESS	OUTPUT
Hint: What will the user input?	Hint: What is the program going to do with the input information?	Hint: What will the screen display after user input?
The program prompts the user for the mass of the object in kilograms. The user will input the mass of their decided object in kilograms.	The program would substitute the user's value for mass in the equation; $\text{Energy} = \text{mass} * (299792458)^2$. Once the program finds the amount of energy, it can figure out how many 100 watt lightbulbs could be powered with it. It uses the equation ; $\text{energy}/360000 = \text{lightBulbs}$.	The screen would display the amount of energy contained in the object in joules. It would display the number of light bulbs which could theoretically be lit.
