Include your IPO Chart with your code in Eclipse IDE: We will discuss and demonstrate this in the computer lab.

IPO CHART

Program name:	DeliveryService.java	
INPUT	PROCESS	OUTPUT
Hint: What will the user input?	Hint: What is the program going to do with the input information?	Hint: What will the screen display after user input?
The program prompts the user to enter the weight of the package in kilograms (<code>weight = input.nextDouble();</code>) It will then prompt the user for the length, width and height in centimetres.	The program calculates the total volume of the package using the formula Length * Width * Height The weight and volume are compared to the threshold of that the package cannot be over 27 kg or 100,000 cubic centimeters. In a series of if and else statements, the program will figure out whether the user violated both thresholds, violated the weight, violated the volume or conformed to the requirements.	The screen prints the parameters the user needs to fulfill.(what is the weight, length, width, height.). If the package had exceeded any threshold, the program would print "Package is too large" "Package is too heavy" "Package is too heavy and too big" However if it fit within the parameters, the program would display "Accepted".
